1.3 Significant News and Other Developments

1.3.1 NASA Works with Air Resource Board to Monitor California Air Quality

NASA and scientists from the CARB are conducting a series of research flights this month to examine the atmosphere over the state to gain an understanding of the chemical dynamics of smog and GHGs, to understand pollution associated with off-shore vessels, and to determine the differences in air mass chemistry from urban and rural areas.

NASA's DC-8 airborne laboratory is flying from the NASA Dryden Aircraft Operations Facility, Palmdale, over an area from San Diego as far north as Trinidad Head along the coast. The DC-8 is used to conduct atmospheric composition measurements for a large environmental science campaign to study the impact of air pollution on the Arctic's atmospheric chemistry and changing climate. It will conduct four flights of varying altitudes between 18 June to 25 June 2008. NASA also is sending a P-3 aircraft from the NASA ARC, and an ER-2 from NASA Dryden to fly over for the collection of additional samples.

1.3.2 EPA Issues Final Area Source Rules

EPA issued final rules for the [metal fabrication and finishing](#) sources and [metal plating and polishing](#) operations for area sources on 12 June and 13 June, respectively. The final rules, which are expected to be published in the FR later this summer, clarify the best management practices and equipment standards included in the proposed rules. Neither area source rule contains new emissions control requirements.

The final metal fabrication and finishing area source rule includes changes from the proposed rule including clarifying the definition of metal fabrication and finishing HAPs "to mean any compound of cadmium, chromium, lead, manganese, and nickel." EPA included a provision in the final rule stating that the rule does not apply to operations performed onsite at military installations, NASA and National Nuclear Security Administration facilities, and aerospace

facilities. The final rule also requires metal fabrication and finishing area sources to "take measures necessary to minimize excess dust" rather than to require scheduled sweeping. Additionally, new management practices include that items larger than 8 feet in any dimension can be abrasively blasted without the requirement for control devices. The proposed rule included provisions to prohibit abrasive blasting during wind events and on substrates with coatings containing lead. These prohibitions were not included in the final rule.

In the final plating and polishing area source rule, EPA did not set new emissions control levels. Plating and polishing area source facilities would be required to follow management practices, such as using a fume suppressant in electroplating tanks, and capture and control of emissions from thermal spraying and dry mechanical polishing. New sources would be subject to the same requirements as existing sources, with the exception of new thermal spraying operations, which would be required to control emissions with filtration devices or the equivalent level of control.

Both metal plating and polishing and metal fabrication and finishing facilities will be required to submit initial notifications of applicability and compliance status, to submit annual compliance certifications and deviation reports, and to keep records to demonstrate compliance with the proposed rule. Neither group of facilities would be required to test emissions.

Require that the manufacturer of a listed electronic device notify retailers that the electronic device is a covered electronic device. Provide that the manufacturer of an electronic device that, when discarded, would not be a hazardous waste, would not be subject to the regulations. <u>Prohibit an electronic device from being sold or offered for sale if the electronic device is prohibited from being sold or offered for sale in the European Union due to the presence of certain heavy metals.
